WINDOW REPLACEMENT CHECKLIST

If you live in your home long enough, you'll likely have to replace your windows. But how will you know when it's the right time? Draftiness, cracked or broken windows, or difficulty opening and closing your windows are just a few of the signs that it's time to consider new windows. The following checklist can help you determine when to upgrade your home's windows.

Windows Don't Work Properly

If your windows are difficult to open and close, or don't stay open on their own, it's probably time to consider replacement.

Temperature Control Issues

If you feel drafts around your windows or struggle to maintain a comfortable temperature in your home, your window seals may be failing.

Rising Energy Costs

Unexplained increases in your energy bills could indicate that your windows are poorly sealed. Seal failure lets air escape, causing your HVAC system to work harder to keep the temperature in your home consistent.

Noise Pollution

If outdoor noise is easily heard inside your home, your windows may not be providing proper sound insulation.

Outdated Style

If your windows are outdated or mismatched, replacing them can enhance your home's curb appeal.

Visible Window Wear and Tear

Signs of damage such as cracked or rotting frames, peeling paint, and warped window sashes indicate that your windows need replacement.

Condensation or Water Damage

If you see water between the glass panes, leaks, water stains, or signs of wood rot, it's time to consider new windows.

Visible Damage to Your Home

Lastly, if you notice wood rot or other damage in your windows, or if the carpet and furniture around your windows appear faded, it's a clear sign your windows need replacement.
